

## 19. 分数式 通分・2項に分割②

**1** 次の式を完成させなさい。

$$\textcircled{1} \frac{3x - y}{2} = \frac{\quad}{6}$$

$$\textcircled{2} \frac{-2a + 5b}{3} = \frac{\quad}{12}$$

$$\textcircled{3} \frac{a - 4b}{5} = \frac{\quad}{20}$$

$$\textcircled{4} \frac{5x - 2y}{6} = \frac{\quad}{30}$$

$$\textcircled{5} \frac{3x + 8y}{4} = \frac{\quad}{20}$$

$$\textcircled{6} -a + 3b = \frac{\quad}{6}$$

**2** 2つの項に分割しなさい。

$$\textcircled{1} \frac{3x - 10y}{2} = \quad x \quad y$$

$$\textcircled{2} \frac{6a - 2b}{6} = \quad a \quad b$$

$$\textcircled{3} \frac{18a - 27b}{9} = \quad a \quad b$$

$$\textcircled{4} -\frac{5x + 7y}{12} = \quad x \quad y$$

$$\textcircled{5} -\frac{16a + 8b}{8} = \quad a \quad b$$

$$\textcircled{6} -\frac{4x - 15y}{20} = \quad x \quad y$$
